

Rackmount AlphaServer systems for the Internet

Flexible, scalable building blocks in high-performance, space-saving packages

You need an Internet server with superior performance and the high availability demanded by mission-critical applications. And you need it now, complete with the right Internet software to get you up and running. The answer is Digital's Rackmount AlphaServer systems for the Internet. They're fast becoming the platform of choice for Internet Access and Service Providers, as well as organizations involved in Internet publishing, information sharing, collaboration, or commercial enterprise.

Digital's Internet servers

Services and applications on the Internet are expanding at an extraordinary pace. Serious engagement in the Internet demands platforms with superior performance, reliability, and management features. Rackmount AlphaServer 1000 4/266 and 2100 4/275 systems are those platforms.

Benefits

- 64-bit Alpha processors drive high-performance I/O to handle the most demanding processing and networking challenges.
- Rackmounting consolidates systems, storage, and communications options in a functionality-packed cabinet that maximizes use of floor space and provides clean, orderly cabling.
- Off-the-shelf building blocks are integrated and tested to insure a highly available system that keeps your business on-line.
- StorageWorks modular subsystems enable you to buy the storage you need today and to seamlessly expand to store terabytes of information.
- Internet software is pre-tested and pre-packaged so you're up and running quickly and easily.
- A complete family of Rackmount AlphaServer systems — from workstations to mainframes — precisely meets your Internet needs.

If the Internet is vital to your business, then your Internet servers are vital to you. And there's no better server choice than Digital's Rackmount AlphaServer systems. They combine superior performance, high availability, space saving features, and all the software you need to create a UNIX Internet server or an NT Web server.

Packaged power and performance

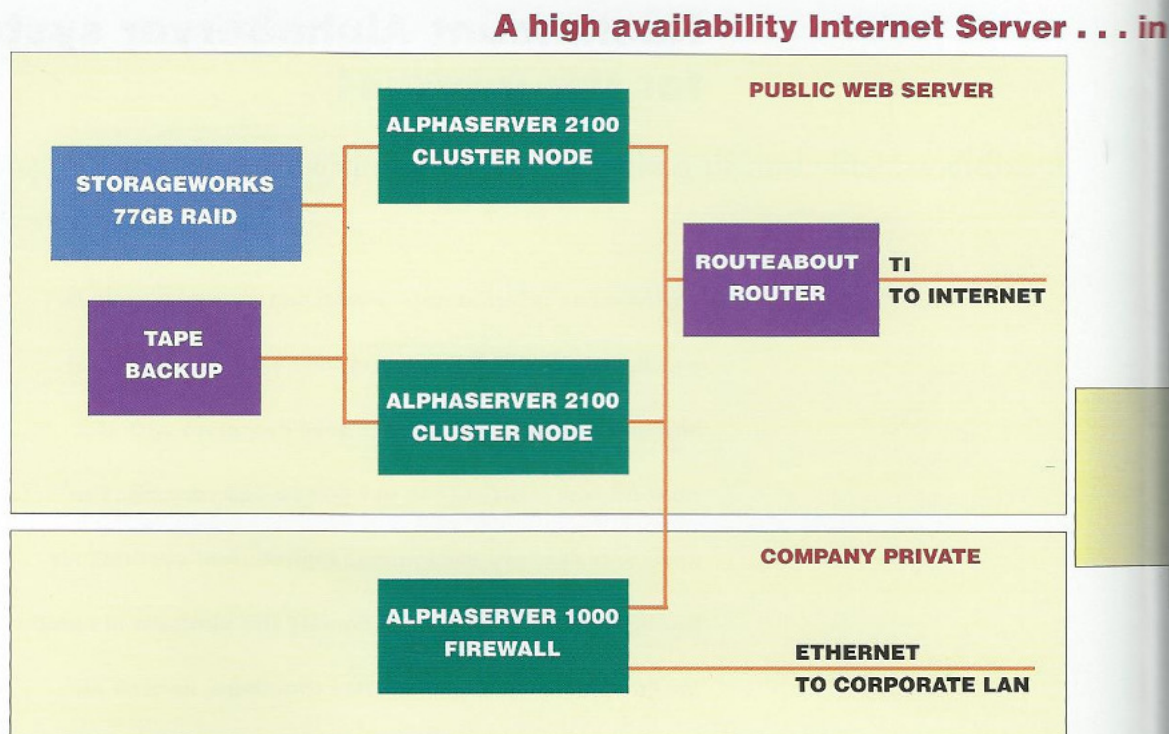

64-bit alpha RISC processors provide the high clock speeds, large address space and wide data paths needed to process and move information quickly. Balanced system designs — with extremely fast backplanes, large cache, and as much memory as needed — fully utilize the powerful Alpha processor.

High performance PCI connections to fast and wide (16 bit) SCSI devices provide high performance I/O using the latest industry standard technology.

Designed for high availability

Digital's rackmount systems deliver high availability at every level.

Rackmount AlphaServer system building blocks have standard features — auto reboot, thermal management, ECC memory, error logging, and parity detection — to ensure maximum uptime.

In-cabinet storage is primarily located in StorageWorks shelves with hot swappable disks, redundant power supplies, redundant controllers, dual ported storage, and a choice of RAID Levels 0, 1, 0+1, or 5.

AdvantageCluster: moving to a higher level

For even higher levels of availability, configure multiple UNIX systems as an AdvantageCluster with DECsafe Available Server software continuously monitoring all cluster systems.

In the event of a failure, the remaining systems pick up the workload and rapidly restore service to all users.

Experience has shown that applications resume processing in less than 30 seconds after a failure. The capability built into the AdvantageCluster Available Server family provides the uptime you need for critical applications with the cost structure of an off-the-shelf system.

Easier to maintain

Reliability and serviceability make Rackmount AlphaServer systems an ideal choice for Internet applications that require high availability with little or no onsite support. Rackmount AlphaServer systems are mounted on slides for easy access to all necessary components. Clean, orderly cabling

minimizes errors and confusion. The result is easy service with lower costs and minimum down time during service.

Customized solutions from off-the-shelf building blocks

Each solution is based on off-the-shelf building blocks — your choice of system, storage, communications, specialized components, and cabinet — tailored to your specific requirements.

This building-block approach means that we can quickly assemble and ship your customized solution as though it were an off-the-shelf product.

in one compact cabinet

Building blocks are mounted in a standard ANSI/EIA 19-inch rack providing maximum flexibility to meet current needs while supporting future expansion with Digital or third-party options.

Because your Internet server is assembled, integrated, pre-loaded with operating system software, and tested at our ISO 9001 facility, it arrives at your site, "ready to go." Installation is fast and flawless.

A complete family of Internet solutions

Although most needs will be met by the AlphaServer 1000 or the AlphaServer 2100, you can choose from the complete family of system building blocks that ranges from the AlphaStation 200 workstation to a six-processor Symmetric Multiprocessing (SMP) AlphaServer 8200.

Scalable systems meet current and future needs

The modular design of our Internet solutions lets you select the system that meets your exact needs, then expand as your requirements evolve.

You can integrate multiple systems in a single cabinet to form a cluster, add a firewall, or do both. You can expand AlphaServer 2100 or 8200 systems by adding SMP CPU(s).

And as new Alpha processors are developed, you'll be able to field-upgrade your system with a single board swap, protecting your investment as you increase system performance. The choice is yours.

Increasing your storage capacity works the same way. Digital's StorageWorks modular approach means you can start with the storage you need now and easily grow to store terabytes of information.

Build up — not out

Floor space is often a high-priced commodity that can exceed \$130 per square foot. Rackmount AlphaServer systems make maximum use of floor space by building up — not out.

A dual-host Rackmount AlphaServer system, for example, requires half the space of a comparable pedestal configuration while providing space for more storage and integrated communications equipment.

Integrated Internet software

The Rackmount AlphaServer systems for the Internet come with Internet software and a choice of operating systems — either Digital UNIX or Windows NT.

Digital UNIX

UNIX systems include the Digital UNIX operating system, NAS 200, and Netscape Communications Server software. What's more, you get Digital's ELECTRONIC LOCKER software to ease system administration chores, as well as a selection of popular public software tools that provide World Wide Web, News, Mail, and WAIS services.

Windows NT

NT systems include the Windows NT operating system, Purveyor WWW Server software, and a selection of popular public software tools that provide Gopher, News, and FAX services. Also included are editors, viewers, and HTML authoring software.

Integrated communications add the final touch

To complete your custom Internet solution, we can easily integrate routers, terminal servers, asynchronous multiplexers, and modems in standard racks along with systems and storage building blocks.

You're covered

All AlphaServer systems for the Internet are covered with a three-year onsite, next-business-day response time warranty.

A broad range of service and support

Whether you require training, consulting, network integration, software support, or comprehensive system maintenance, Digital is the single-source solution to meet your needs.

**Rackmount AlphaServer Systems for the Internet specifications**

	Rackmount AlphaServer1000 4/266	Rackmount AlphaServer 2100 4/275
Processor		
Processor/clock speed	Alpha 21064A 266 MHz	Alpha 21064A 275 MHz
Symmetric Multiprocessing	No	Up to 4 processors
Cache (per processor)	2 MB on-board	4 MB on-board
Memory	64 MB ECC	128 MB ECC
Maximum memory	1 GB ECC	2 GB ECC (1 GB for 4 CPU system)
In-cabinet upgrade	Yes	Yes

Performance

SPECint92 (per processor)	197.5	202.9
SPECfp92 (per processor)	263.8	292.6

I/O

I/O support	2 PCI, 7 EISA, and 1 PCI/EISA slots	3 PCI and 8 EISA slots
Max. I/O bandwidth	PCI: 132 MB/s, EISA: 33 MB/s	PCI: 132 MB/s, EISA: 33 MB/s
Storage included in system building block	2 GB disk, floppy disk, CD-ROM, 2 slots for 2 or 4 GB disk, 1 slot for 5.25" half-height removable media	2 GB disk, floppy disk, CD-ROM, 1 slot for 2 or 4 GB disk, 1 slot for 5.25" half-height removable media
Optional in-cabinet storage (67-inch high cabinet)	331 GB, (up to 11 shelves, 7 RZ29 drives/shelf)	270 GB, (up to 9 shelves, 7 RZ29 drives/shelf)
Integrated graphics controller	SVGA	VGA

High-availability features and options (all systems)

System	Auto reboot, thermal management, ECC memory, error logging, (SMP CPU failover, 2100 4/275)
StorageWorks	RAID (0, 1, 0+1, 5), hot swap disks, redundant power supplies, redundant controllers, dual-ported storage
Other options	Uninterruptible Power Supply (UPS)
AdvantageCluster (UNIX)	DECsafe ASE

Other options (all systems)

Networking	Ethernet, FDDI, Token Ring, synchronous communications
Storage	Fast SCSI, FWD SCSI, RAID, Prestoserve (Digital UNIX only)
Modems	Hayes Millennium or Century rackmount modems
Firewalls	Digital Firewall for UNIX and Digital's Firewall Service (UNIX only)
Enclosures	Choice of ANSI/EISA 19-inch cabinets from 43- to 81-inches high

Hardware warranty	Three-year onsite, next-business-day response time.
--------------------------	---

Rackmount AlphaServer for the Internet software

Systems with Digital UNIX	Netscape Communications Server, ELECTRONIC LOCKER, Public Internet software, Digital UNIX base license, Digital UNIX unlimited user license, NAS 200
Systems with Windows NT	Purveyor WWW server software, Public Internet software, Windows NT Server plus 5-client access, V3.5 media (CD-ROM) and license in shrink-wrapped package.
Software warranty	90 day SPD conformance, with advisory telephone support (Public software is excluded)
